Male Victims of Coercive Control

Mark Brooks OBE
Chair of Trustees

The ManKind Initiative

ManKind Initiative

Helping men and their children escape from domestic abuse

- First British charity (since 2001) set up to support male victims and their families. Set up and run by women and men
- Based in Somerset providing:
 - Direct services (UK helpline)
 - National Service Standards
 - Practitioners Network
 - Support through CPD training, presentations and helping others
 - Giving Male Victims a Voice

Contextual Framework

- More victims are women
- Services are needed for men however no services should be taken away from female victims
- It is not a competition between genders so vital not to set up comparisons **between** genders but **within** genders
- 21st Century Approach: Gender-informed, Gender Inclusive and Non-Ideological

Overall “Official” Picture

British Crime Survey

- 1 in 6/7 men and 1 in 4 women will be a victim in their lifetime
- 760,000 men and 1.56 million women are victims of domestic abuse (500,000 and 1.2 million women – partner abuse)
- Over a three year period (April 2016 to Mar 2019), 88 men were killed in domestic homicides (38 by a partner or ex-partner) by a partner or ex-partner (274 and 222 women respectively).
- The percentage of gay men (6.0%) or bi-sexual men (7.3%) who suffered domestic abuse in 2019/20 is more than for heterosexual men (3.5%).
- 1 in 5 victims of forced marriage are men
- 1 in 4 victims of stalking are male
- 1 in 4 victims of revenge pxrn are men

Overall Picture

Who do men tell

- Male victims (49%) are nearly three times as likely than women (18%) not to tell anyone they are a victim.
- 13.6% of male victims will tell a work colleague (11% women)
- 59% of our male helpline callers have never spoken to anyone
- 70% of our male helpline callers would not have called if the helpline was not anonymous.

Police

- One in four victims who report to the police are male (19/20)

Service Engagement

- Less than one in 20 victims who engage with local support services are men (19/20)

Why Research is Vital

Key barriers for men that prevent men escaping include:

- Societal/gender stereotypes
- Lower levels of professional curiosity in criminal justice and “social care” sectors
- Lack of profile
- Public Policy narrative minimises the existence of male victims, their children and their voices (Male victims and their children are officially classed as victims of “Violence Against Women and Girls” crimes and “domestic abuse is a gendered crime”)

Research means:

- Better public understanding
- Increased professional recognition in public services
- Accountability
- Better policy, services and funding
- A more inclusive, equal, fair and human-rights based society

More men and children escape

ManKind Initiative

Men are victims too
Training, information and presentations to help you support male victims of domestic abuse

If you are a police force, local authority, GP, charity, housing association or third sector voluntary organisation willing to create a service to enhance how you already support male victims of domestic abuse, the ManKind Initiative charity is committed to providing the support you need. By adopting a partnership approach, the charity will ensure your individual needs are identified and met.

With men in our lives likely to suffer domestic abuse in their lifetime and one in every three victims being male, organisations and practitioners working with domestic abuse victims are increasingly being asked to consider how to best support the support they need in their local community.

This also involves the need for statutory authorities to comply and meet the duties and requirements of the Equality Act 2010 especially the Public Sector Equality Duty with regard to supporting men victims and their children.

National Conference on male victims of domestic abuse
Surviving Domestic Abuse
10 October 2013

With one in ten men likely to suffer domestic violence in their lifetime and one in three domestic abuse victims being male, there is a growing need to ensure men and their children receive support in their community from local organisations in the statutory, private or third sector. For statutory agencies it is a requirement. ManKind sector initiative aims to ensure there is support available for male victims.

This conference will feature a range of professionals and academics working across the domestic abuse sector. They will highlight how they can help to ensure male victims and their children in their local community can be supported as well as exploring the opportunities and barriers these victims face.

Speakers include:
Rajiv Gohil DBE - Chief Crown Prosecutor, CPS, Thames and Chiltern
Ian McNeill and Mark Chapman: Domestic Abuse Survivors
Dr Nicola Graham-Russell: Senior Lecturer, University of Central Lancashire
Dr Nicola Russell: Senior Lecturer, Department of Psychology and Behavioural Sciences, Coventry University
Derek Davidson: Director, Berkshire East and South Bucks Homeless Aid
Rufus Pridmore: Chief executive, Broken Borders

Date: Thursday 10 October 2013 (9.30am to 4.30pm)

Venue: MADD Conference Centre, 20 Gordon St., Strough, Berkshire, SL3 4UG
<http://madd-conference.com>

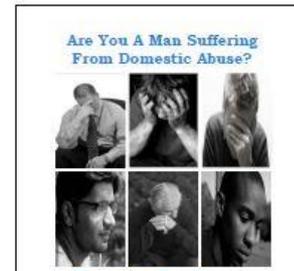

Though it is easily accessible by rail, and an 800 mile car journey from London (M25 to M40, off the M4 (Junction 6) and onto the A4120), the parking facilities at the venue need to include car registration on leaving forms.

Cost: £15 per place for statutory agencies, housing associations and private sector organisations, £100 for other places

£35 per place for (non housing associations) other third sector organisations (£15 for three places)

Booking: A booking form can be downloaded via www.mankind.org.uk/conference.html or by emailing training@mankind.org.uk. You can just also register your interest via training@mankind.org.uk

Programme: Available at www.mankind.org.uk/conference.html

MALE VICTIMS OF COERCIVE CONTROL

PROFESSOR NICOLA GRAHAM-KEVAN

DIRECTOR OF THE CENTRE FOR CRIMINAL JUSTICE RESEARCH AND PARTNERSHIP

UNIVERSITY OF CENTRAL LANCASHIRE

A PATTERN OF BEHAVIOUR

Types of behaviour

The types of behaviour associated with coercion or control may or may not constitute a criminal offence in their own right. It is important to remember that the presence of controlling or coercive behaviour does not mean that no other offence has been committed or cannot be charged. However, the perpetrator may limit space for action and exhibit a story of ownership and entitlement over the victim. Such behaviours might include:

- isolating a person from their friends and family;
- depriving them of their basic needs;
- monitoring their time;
- monitoring a person via online communication tools or using spyware;
- taking control over aspects of their everyday life, such as where they can go, who they can see, what to wear and when they can sleep;
- depriving them of access to support services, such as specialist support or medical services;
- repeatedly putting them down such as telling them they are worthless;
- enforcing rules and activity which humiliate, degrade or dehumanise the victim;
- forcing the victim to take part in criminal activity such as shoplifting, neglect or abuse of children to encourage self-blame and prevent disclosure to authorities;
- financial abuse including control of finances, such as only allowing a person a punitive allowance; threats to hurt or kill; threats to a child;
- threats to reveal or publish private information (e.g. threatening to 'out' someone).
- assault;
- criminal damage (such as destruction of household goods); rape;
- preventing a person from having access to transport or from working.

This is not an exhaustive list

EVAN STARK

- At this point, I ask readers to take two things on faith: that the pattern of intimidation, isolation, and control . . . is unique to men's abuse of women and that it is critical to explaining why women become entrapped in abusive relationships in ways that men do not (p. 102)

GENDER-NEUTRAL NATURE OF THE CCB OFFENCE (MARCH 2021)

- Some academics (such as Barlow et al., 2019; Stark & Hester, 2019) believe that the gender-neutral wording of the CCB offence requires revision.
- They argue that positioning CCB as predominantly a crime committed by men against women may mean that coercive control is identified more easily (Barlow et al., 2019).

- **Much of the domestic abuse literature indicates that coercive control is perpetrated almost exclusively by men** (Johnson, 2006; Monckton Smith, 2019; Stark, 2007; Wiener, 2017, citing Dobash and Dobash, 2004).
- Stark (2007; 2018) positioned coercive control as an extension of ‘gendered inequality’ among heterosexual partners
- Statutory guidance framework for the CCB offence **recognises** its gendered nature: “Controlling or coercive behaviour is primarily a form of violence against women and girls and is underpinned by wider societal gender inequality” (Home Office, 2015b).

UK SAMPLE COLLECTED BY TONIC FOR IBB LAW: 998 WOMEN & 1005 MEN

Coercive Control Type	Men	Women
Economic	29%	22%
Monitored	30%	23%
Destroyed possessions	27%	20%
Hid tech devices	24%	14%
Did nothing about it	48%	33%
Left partner	11%	37%

DOVE

We aimed to assess intimate partner violence (IPV) among men and women from six cities in six European countries. Men and women predominantly experienced IPV & Control as both victims and perpetrators with few significant sex-differences within cities. Results support the need to consider men and women as both potential victims and perpetrators when approaching IPV.

SUBTYPES OF VIOLENT SEPARATING OR DIVORCING COUPLES SEEKING FAMILY MEDIATION

1. Mutual violent control group 20%)
2. Male-perpetrated coercive controlling violence group 22%)
3. Female-perpetrated coercive controlling violence group 23%
4. Mutually low violence and abuse group 35%

- Coercive control is not merely the behaviour of men with many studies finding that male and female IPV victims appear equally likely to experience highly controlling partners (e.g., Avant et al. 2011; Ballard, Holtzworth-Munroe, Applegate, 2011; Bates, Graham-Kevan & Archer, 2014; Bates & Graham-Kevan, 2016; Brownridge, 2010; Carroll et al., 2010; Foran et al. 2011; Graham-Kevan & Archer, 2009; Hamel, Jones, Dutton, & Graham-Kevan, 2015; Kasian & Painter, 1992; Rogers & Follingstad, 2011; Straus & Gozjolko, 2014), with this body of research including a population survey (Laroche, 2005) and a systematic review (Carney & Barner, 2012). Similarly, there is research that

Schnurr, Mahatmya & Basche, 2013) including a systematic review (i.e., Langhinrichsen-Rohling, McCullars & Misra, 2012)

OLDER ADULTS (POLICASTRO & FINN 2015)

- Using data from the National Elder Mistreatment Study, this research examined if coercive control is more evident in physical violent victimisations of older adults (age 60 or older) when the perpetrator was an intimate partner.

SAME SEX COERCIVE CONTROL (FRANKLAND & BROWN, 2014)

- These data demonstrated the presence of patterns of control and violence consistent with categories originally identified in heterosexual couples.

WOMEN'S REPORTS & IMPACTS ON CHILDREN (JOURILES & MCDONALD, 2015)

Of the 61 couples who engaged in coercive-controlling physical IPV, there were 33 in which only the mother's IPV was reported to be coercive, 18 in which only the partner's IPV was reported to be coercive, and 10 in which both partners' IPV was reported to be coercive.

Results indicated that coercive control was related to each of the measures of child adjustment problems

“That is, women may use coercion to gain their child's compliance, and manipulate, be disrespectful of, or undermine their child's autonomy”.

COERCIVE CONTROL DURING THE TRANSITION TO PARENTHOOD: AN OVERLOOKED FACTOR IN INTIMATE PARTNER VIOLENCE AND FAMILY WELLBEING? (GUO ET AL., 2019)

- Longitudinal community sample of 98 heterosexual couples: third trimester of pregnancy/1 and 2 years postpartum.
- Women's coercive control predicted their own as well as men's perpetration of IPV across the transition to parenthood.
- Women's coercive control was longitudinally predictive of **men's depression, harmful alcohol use, relationship dissatisfaction, poor co-parenting, low perceived parenting competence & perceptions of toddler problem behaviour.**

We expected that this difference between the sexes would vary between the two questions based on expert guidance from the Office for National Statistics (ONS) Domestic Abuse Statistics Steering Group (DASSG).

However, some of the group suggested that the sex difference would be larger for controlling or coercive behaviour than for non-physical abuse. Our findings are not consistent with this expectation.

Controlling or Coercive Behaviour in an Intimate or Family Relationship
Statutory Guidance Framework

December 2015

HIDING MEN'S IMPACT

- Not asking men
- Not reporting men's experiences (e.g., Hester et al., (2019) summarise the findings as “this supported their hypotheses that coercive control would have a direct effect on victimisation for women and predict specific facets of ‘post-relationship distress’ (such as escalating violence and fear of mediation) far better than relationship violence”.
- What Hester et al., fail to include is this research also included men and found that “CC by men against women causes women's victimization. Likewise the CC by women against men causes men's victimization. This means that both women and men have similar patterns of abuse tactics as instrumentalities of CC”.

DUTCH SAMPLE OF MALE & FEMALE OUTPATIENTS

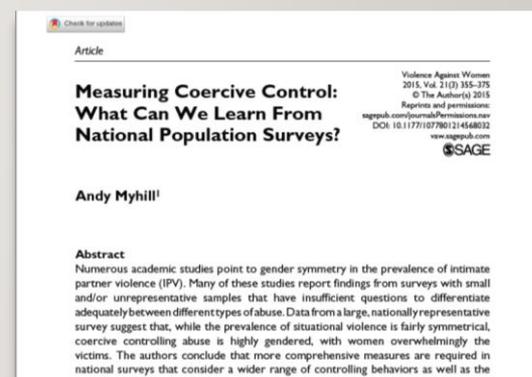

- “Note that women scored higher on coercive control than men & there were relatively more women in the high controlling cluster (29% female) than in the low controlling cluster (17% female)”
- **“Nonetheless, we think the most appropriate way to evaluate Johnson’s prediction that controlling violence is mostly & near exclusively, perpetrated by men is to assess the proportion of men in the high controlling cluster. With 71% male, the high controlling cluster was predominantly, but not exclusively, male”.**
- “The majority of our patients engaging into controlling violence were men, substantiating the idea that controlling violence is more often committed by men than by women”
- Note that this finding is qualified by the fact that our entire sample was predominantly male.
- BUT of all males 20% were high control and 29% of women so 1:3 women & 1:5 men highly controlling

REPLACING PRONOUNS

- Research on coercive control has primarily focused on female victims, thus comparatively less is known about how men experience it (Follingstad, 2007). Similarly, many of the instruments used to assess coercive control are based on women's experiences as victims (e.g., O'Leary 2001; Pence & Paymar, 1996).
- As a result, there lacks a thorough and well grounded conceptual and operational understanding of this phenomenon in male victims. McHugh, Rakowski and Swiderski (2013) argue that an approach that merely changes the pronouns is inadequate, and instead the starting point should include an analysis of men's experience or coercive control as reported in open-ended questions.

WHERE DIFFERENCES ARE FOUND

- Langhinrichsen-Rohling (2010) suggests that a typology with fear as a determining factor may underestimate the prevalence of IPV experienced by men due to men being socialized not to express vulnerability.

-
- Fear of losing children—A victim may be fearful of their children being taken away if they make a report and the perpetrator may have tried to convince them that this is the case.

**Controlling or Coercive Behaviour in an
Intimate or Family Relationship**
Statutory Guidance Framework

December 2015

Male Victims Experience of Coercive Control

In common with Women's Experiences

- Threats
- Intimidation
- Emotional
- Isolation
- Economic
- Sexual
- Post Separation

Specific to Men's Experiences

- Children
 - Safety of children if they leave
 - Losing the relationship with their children
- Legal & Administrative
 - False Allegations
 - Using the legal system against them
 - Not being believed by support services

Coercive control Specific to men

- 64% of men had been threatened with false allegations to the police or social services
- Over 1 in 4 men had been threatened with false allegations of sexual abuse or rape
- Just under half the men said the police had been used to continue the abuse post separation
- Over 1 in 2 men said the courts had been used to continue the abuse
- 63% of men said the children had been used to continue the abuse
- 84% of men had been threatened with taking their children away

Many men didn't think they would be believed...

"Because she would threaten to tell the police I beat her up and who would they believe ...I'm 6 ft 2"

"For what purpose? Nobody cares if you are a bloke"

"I don't think I'd be believed & I don't think there's any help for me"

"Pointless, police don't believe men."

"Services are near non-existent for men and again, I reiterate, men are not believed."

Impact for Male Victims
